

## **Seasonal Adjustment of Philippine Time Series on Labor and Employment: 1988 - 1993 (April)**

**Elsie Buenaobra, Elena Daguidi and Teresa Edora**

### **1.0 Introduction**

The Integrated Survey of Households (ISH) conducted quarterly by the National Statistics Office (NSO) has been the major source of the labor force and employment statistics in the country. Conducted since 1956, it has depicted the current trends and changes in the labor market and employment situations. The labor force concept has undergone revisions and changes for the past three (3) decades and in 1986, a major revision was effected. The reference period was shifted back from past quarter to past week. It is now conducted every January, April, July and October.

For seasonal adjustment of Philippine Time series on labor and employment, only the following major variables shall be deseasonalized as agreed upon by the Technical Committee of the project:

1. *Labor Force* - the population 15 years old and over who contribute to the production of goods and services in the country. It includes those who are either employed or unemployed.
2. *Employed* - persons in the labor force who were reported either at work or with a job or business although not at work.
3. *Underemployed* - employed persons who expressed the desire to have additional hours of work.
4. *Unemployed* - persons in the labor force who did not work or had no job/business during the reference week but were reported available and actively looking for work but cannot find work.

### **2.0 Seasonal Adjustment Using X11-ARIMA**

Since changes in the concept have been made, data starting 1987 were studied. However, initial findings did not show good results and also the fact that the country has just undergone a major political change. Thus, for consistency of data for all agencies involved in the project, the consultant, Dr. Estela Bee Dagum of Statistics Canada recommended to cut the series from 1988 onwards.

Initially, the group has studied numerous series of labor force statistics, results of which are shown in the attached Appendix. The employment-series were further broken down by sex, age group sector and area. By sex, only the male group has seasonality while by sector, only the service sector did not have identifiable seasonality present. Due to limited time, the group has studied only age groups 15-19 and 20-24 which accounted for the seasonality in the labor force statistics. By area, i.e., urban and rural, further probing was discontinued since there was a change in the definition of urban and rural in 1990.

For underemployment series, though it was rejected at 1.20 level, identifiable seasonality was present at 0.1 percent level. Data series are very irregular which need prior adjustment to smoothen the two measures which failed. For purposes of exercise, results of the test for the underemployed is presented but no analysis was made because of inconclusive results.

Direct seasonal adjustment were done in employed, underemployed and unemployed. On the other hand, for labor force series, it was recommended that an indirect method be used. In determining the rates, the indirect method was also used. Since there was no labor force survey conducted in April 1990 due to the Population Census, imputations were made for the period.

The multiplicative model was chosen for most of the series. For the employed series, multiplicative model  $(0,1,1)(0,1,1)$  with log transformation was forced in the analysis to smoothen the data.

Data presented in this paper are still preliminary, pending results of the study to be made on the disaggregates of the variables. Though the group have made partial study on the breakdown, these were limited indicators only. Analysis as well were done on the major variables.

### **3.0 Analysis of Seasonally Adjusted Series Until Second Quarter, 1993**

#### *Unemployment*

The country's unemployment rate of 8.6% as of April 1993 was one of the lowest since 1988. The same rate was also recorded in 1989 of the same month. Highest posted were in April and July 1991 at 11.0 percent and 11.1 percent respectively. This could have been due to the aftermath of the various calamities and Gulf War crisis (returning OCWs) felt in 1990 and early part of 1991. Thereafter, unemployment rates gradually tapered off.

The April 1993 unemployment rate was lower by 0.7 percent points from January 1993 rate of 9.3 percent and 1.3 percent points over the same period in 1992. In nominal terms, this translates to some 2.262 million jobless workers or 226

thousand fewer than the January 1993 figure and 314 thousand less than last year's figure of 2.576 million. Efforts of the government in terms of pump priming the economy such as the Special Program for Employment of Students (SPES) and Summer Workshop Appreciation Program (SWAP) could have somehow provided respite for unemployment problem as shown by the decline in the rate of jobless among the youth (15-24 years old).

### *Labor Force*

Labor force participation rate (LFPR) declined to 64.6 in April 1993, the lowest recorded since 1988. The decrease in LFPR has been observed as early as October 1992.

Meanwhile, the labor force shrunk to 26.048 million or by 298 thousand from the January 1993 level. This is a signal that should be monitored as this seems to indicate more people are staying away from the labor market due to the lack of employment opportunities.

### *Employment*

After exhibiting an upward trend since October 1991, the level of employment registered a 0.3 percent decline or a 72 thousand reduction in employment from 24.218 million of January 1993 to 24.146 million in April 1993. Employment declines were also observed in the July rounds of 1990 and 1991 which is the aftermath of the crisis and natural calamities that struck the country.

Peaks in employment were observed in all April rounds of the labor force survey which has been associated by the of vacationing students eager to take temporary jobs. This eventually returned to its normal level in June in time for school openings.

This occurrence is further validated by the initial study on the age groups 15-19 and 20-24 which exhibited strong seasonality among age group bracket during the April rounds of the labor force survey.

The series of natural and man-made calamities (earthquakes, typhoons, wars, coups) that the country experienced from January 1991 to October 1991 employment is reflected by the wild fluctuation in the series during the period.

**Table 1** Labor and Employment Indicators (Adjusted Series)  
Summary Table

Indicators	1993 April	1993 January	1993 April	Quarter to Quarter Change April 1993/January 1993
Labor Force (000)	26,408	26,706	26,070	-1.1
Labor Force Participation Rate (%)	64.6	65.8	65.7	-1.2
Employed (000)	24,146	24,218	23,494	-0.3
Rate (%)	91.4	90.7	90.1	0.7
Unemployed (000)	2,262	2,488	2,576	-9.1
Rate (%)	8.6	9.3	9.9	-0.7
Underemployed (000)	5,139	5,130	4,822	0.2
Rate (%)	21.3	21.2	20.5	0.1

**Table 2** Rates of Labor Force Participation, Employment, Unemployment,  
Underemployment, Philippines: 1988-1993 (Apr)  
(Adjusted Series)

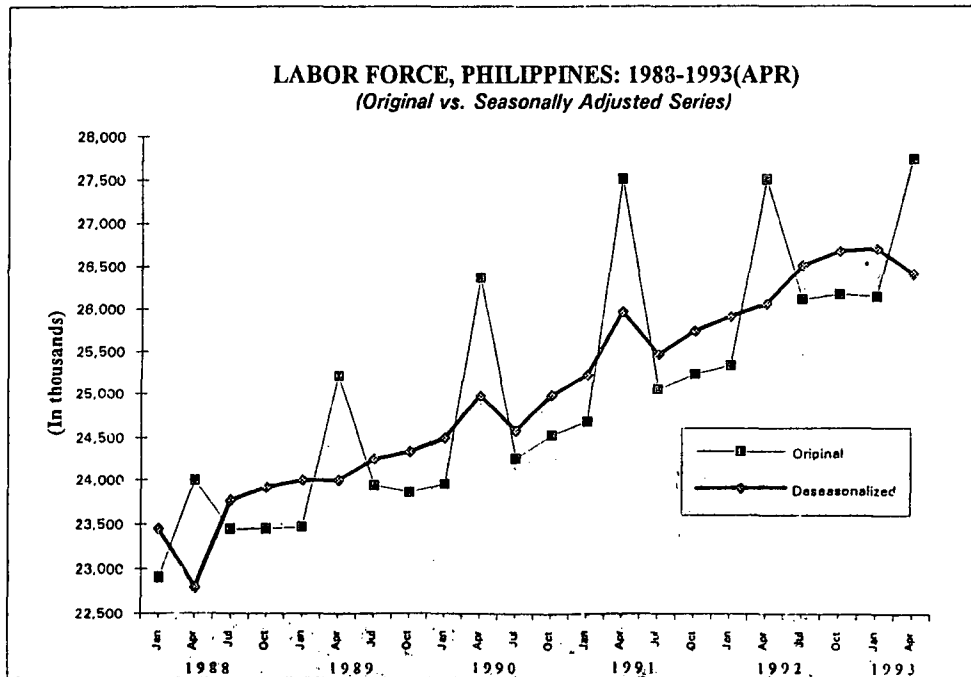

Year	Survey Round	LFPR	Employment Rate	Unemployment Rate	Underemployment Rate
1988	Jan	66.8	89.7	10.3	23.9
